Highlights

These projections are for Alaska's population by age, race and sex for the period 1991-2010 statewide and by age for census areas to 2000.

Between 1959 and 1990, the population of Alaska grew by 329,600, an increase of almost 150%. Annual growth has varied greatly from a high of 9.8% in the oil pipeline boom year of 1974-75 to a low of -1.8% during the oil market collapse in 1987. The average annual growth rate over the 1959-90 period however has been 2.73%, and the 1980's average growth was 2.75%.

The middle series projects a 2.57% annual growth for the decade which would produce a population of 716,500 by the year 2000. An annual growth rate of 1.92% is projected for the following decade which would produce a state population of 868,300 by 2010.

The low and high projections series suggests that the population could range from 679,900 to 755,800 by the year 2000. Alaska's population is projected to range from 787,400 to 961,500 by 2010.

Most of the growth is projected in urban and "suburban" areas of the state predominantly through migration and in rural native areas through natural increase.

The Native population of Alaska grew from 64,103 in 1980 to 86,300 in 1990 at an average annual rate of 2.97% per year during the decade. The middle series projects the native population to grow at an annual rate of 2.30% to 108,700 by the year 2000. Middle series growth is projected at 2.17% to 135,200 between 2000 and 2010.

These projections continue the trend of Asian and Black migration at higher rates than white migration to the state over the next 20 years.

Alaska continues to have higher completed fertility than almost any state at 2.6 children. Fertility of both Alaska Natives and White Alaskans is high and increasing. In 1990, White Alaskans had a completed fertility of 2.4 children. Alaska Natives had an average of 3.9 children, a level higher than many developing nations.

Projected life expectancy for 1990 was 70.9 years for men and 78.0 for women. If the actual mortality in Alaska follows the national projected trends, the projected middle series life expectancy will reach 72.9 for Alaska men and 80.0 for Alaska women by 2010.

The aging of America and Alaska over the next few decades is a key population trend. Older Alaskans are expected to increase by 61.8% over the next decade with a 138.9% increase by 2010. In 1990, about 22,459 or 4.1% of Alaskans were over 65. Middle series projections show an increase to 36,300 or 5.1% by 2000 and 53,700 or 6.2% by 2010.

In 1990, there were 118,008 children between 5 and 17 in Alaska. The middle series shows children of school age increasing to 146,000 by 2000 and 168,400 by 2010. Because of the volatile impact of migration on these ages, the projections range from a low 137,300 to a high of 155,244 by the year 2000. Overall, the middle series projects a 23.7% increase in school-age population by 2000 and a 42.7% increase by 2010. Alaska Natives will make up 21.8% of all school-age children by the turn of the century.

ALASKA

POPULATION PROJECTIONS

Chapter 1

Introduction

This report contains projections of the Alaska population by age, sex and race for the years 1991 to 2010. In addition to the statewide projections, projections are presented by age for borough and census areas by labor market region to the year 2000.

These projections result from a mathematical model which assumes different future trends in fertility, mortality and gross migration. They are based on July 1, 1990 population estimates by age, sex and race, which were developed using April 1, 1990 census data. These data were projected forward using a cohort component method with alternative assumptions for future fertility, mortality, and migration levels.

Population projections differ from population estimates in that current data indicative of population change are available for the estimate year, while they are not available for a projection year. Typically, estimates lag one year as it takes at least 6-12 months for indicator data to be gathered, checked for error, and used in estimating models. Statistics for the current year or future years, therefore, must almost always be projections of recent trends.

This publication serves as a reference work to provide planners and policy makers with probable outcomes of a series of demographic events. These projections are not an attempt to forecast or predict the future course of population development in Alaska. No demographer or economist has a crystal ball that allows them to adequately predict population change. Alaska, perhaps more than other states, is susceptible to events that are not predictable. Without knowledge of the unique historical and political events that might set the state on a different course, the best predictor of future events is past experience, both long-term and recent trends.

Projections are typically least accurate when produced for small groups or during rapid unpredictable change. Both of these characteristics apply to Alaska and, in particular, to small boroughs and census areas. While not all assumptions can be tested, a range of outcomes covering a variety of possibilities is presented. The range of high to low projections is generally wider for Alaska than for other states in order to incorporate a fair range of possible events.

A characteristic of demographic, as opposed to economic, projections is that demographic projections are far more stable. While population and economy are related through employment, the relationship is extraordinarily complex and has defied the best efforts of both demographers and economists to clearly define predictable relationships and their timing. In general, econometric models do not have a good track record predicting population. Demographic projections should, however, be used in conjunction with short range economic forecasts to monitor the current trends.

In considering the relationship between population and economics, if the number of jobs decline, there will be a short-term as well as a long-term decline in population. Areas with few jobs become areas that export migrants to other places. Many people in Alaska came from such places. Communities that consistently export their young, gradually age and either become stagnant, decline or die. In fact, the vast majority of the counties in America and many communities in Alaska are of this character. Fast growth is generally limited to a few isolated localities or parts of localities.

On the other side, populations can create jobs, particularly if there are undeveloped resources or economic activities in a community. Communities large enough to provide markets for certain goods and services will create new jobs and thus provide a certain dynamic growth on their own. As communi-

ties grow, economies of scale create even more jobs. Economies of scale can also subtract jobs in declining communities.

While it is easy to state these relationships in generalities, it is currently almost impossible to recreate them in detail in a model. While demographic and economic phenomena are every bit as complex as weather or ocean behavior, the number of demographic and economic data points currently available are extremely crude relative to the points involved in weather or ocean behavior. The problems of projecting are, however, much the same.

Alaska's General Economic Trends

The following discussion of the Alaska economy relative to this set of projections is of a general rather than a specific nature. Discussions of the economic trends in specific projects or industries should be addressed in economic forecasts. The discussion presents the general economic setting associated with our middle series projections. This gives readers a point of reference from which to integrate their perspective of the economy to the population projections.

Alaska's economy during the time span of these projections depends first and foremost upon oil. This dependence is the single most important variable in the economic health of the state. While any resource eventually runs out, the envelope of oil availability has continually been pushed out statewide, nationwide and worldwide. It is highly probable that substantial undeveloped oil and gas reserves exist in Alaska. While the timing or wisdom of developing these reserves is subject to debate, development is nonetheless very probable. It is also clear that economically efficient recovery techniques currently in use in other states, will substantially extend the life of Alaska field reserves. A strong demand for American oil will continue through the projection period.

Price is the second and most volatile element in the oil equation. The price of oil has always been an unstable commodity with drastic swings during the past twenty years. Petroleum prices for the period of these projections will undoubtedly continue to be an uncertainty and will likely contribute to continued "Boom/Bust" instabilities in Alaska's economy into the next century. Consequently, the money available from oil will continue to be a major volatile factor in the relative prosperity or lack of prosperity of Alaska's population, and in the available funding for state and local government as well as capital and infrastructure development.

Other activities important to Alaska's economy but less influential, are forestry, fishing, hard rock mining, tourism and federal spending. The first four of these provide crucial jobs for different regions of the state. Dramatic changes in any of these can significantly influence population in local areas. Alaska industries, in general, tend to be controlled by non-Alaska based companies. Alaska is, therefore, heavily dependent on decisions made in broad national or world markets. A number of Alaska's key lumber mills and fisheries corporations are owned by Japanese. Most economic forecasts suggest that expansions in timber are less likely than contractions. It is also likely that decreasing stocks of wild fish and increasing quantities of farmed fish worldwide will continue to depress the fishing industry. Mining too is heavily owned by international companies. The demand for and thus price of minerals is currently low and not likely to rise dramatically in the near future. As we move through the decade, it is probable that Soviet oil, gold and minerals may be added in increasing quantities to the world market. While the impact may not be immediate, it could be felt in the next few years. The tourism industry in Alaska employs many Alaskans, but is largely controlled by large non-Alaskan companies. While tourism can expand, Alaska remains a relatively expensive tourist destination with worldwide competition. This industry also suffers boom/bust cycles caused by dollar fluctuations, world politics and shifting trends in tourist interest.

Federal spending in Alaska has been heavily military. Given cutbacks in federal and military spending, declines are likely. However, for these projections, the 1990 level of military in Alaska was assumed to be constant.

Lastly, state and local government are a major source of employment and are usually considered to be a basic industry in Alaska. During the last decade, government has been heavily dependent on oil revenue for support. The current trend is towards a reduction in government employment. The middle series would accommodate small declines in government during the decade. Large cuts in government employment would, however, have a negative impact on the state's economy and would tend to undermine the middle series projections.

While nothing here spells doom for Alaska's economy in the immediate future, there is also nothing that suggests an immediate boom on the order of the

Table A.
Principal Fertility, Mortality and Net Migration Assumptions For Each Projection Series.

Series	Mortality	Fertility	Net Migration
High	Low	High	High
Middle	Middle	Middle	Middle
Low	High	Low	Low
Zero Migration	Middle	Middle	Zero

Source: Alaska Department of Labor, Research and Analysis, Demographics Unit.

pipeline or the secondary boom of the early 1980's. Major capital projects may occur in the 1990's, but are not likely to immediately spawn major growth. The environmental clearances and preparatory work needed for any major project often take several years to complete. Further oil and gas exploration and development could have a substantial impact on the state, if and when they occur. While such events are possible, our perception is that a major boom in the short-term seems unlikely. Nevertheless, these projections allow for such a possibility as part of the high series. Similarly, to the degree that the economy may be viewed more pessimistically than the assumptions outlined here, the low series may tend to be more realistic.

Because the Alaska economy is volatile, a range of projection scenarios covers what we consider the most probable outcomes for the near-term future. Because of the extreme fluctuations in Alaska's economy since statehood, history has provided reasonable ranges for growth that are unlikely to be exceeded. Readers may, depending on their degree of optimism regarding Alaska's future, choose the set of projections that most fits their perception of future events. Our middle series is based on our perception of the most likely scenario of the population growth for the near-term future as basically defined by Alaska's history since statehood.

Two key components affect population growth. They are natural increase and migration. Births and deaths are the events that affect natural increase. These are not particularly susceptible to the state's economy, though economic recession tends to dampen birth rates as people delay having children. Migration is most affected by the relative health of the economy.

The net balance of migration is composed of separate trends of in-migration and out-migration. In-migration is the most dependent on current economic events. Somewhat surprisingly, in-migration to Alaska is frequently more dependent on the relative economies of our key population "feeder" states of Washington, California and Oregon than on the Alaska economy alone. Thus within limits, migration to Alaska in search of employment is fueled by the real and perceived health of the Alaska economy relative to the economies of neighboring states.

Out-migration tends to lag behind changing economic events. People are generally reluctant to leave their communities even when economic conditions are bad. Out-migration from Alaska's urban areas in response to changing economic conditions tends, however, to be considerably more rapid than found nationwide. Alaska has the highest levels of in and out migration of any "state", except the District of Columbia. On average, Alaska turns over 9% of its population every year. The fact that a smaller than average percentage of our population has deep roots in Alaska undoubtedly contributes to a greater willingness of people to leave when times get hard.

Projection Series Assumptions

Three different assumptions are made about the future course of births, deaths and migration. These assumptions as they relate to the different projections series are shown in Table A. The series using the middle assumption for each component is logically

Table B.
Total Fertility Rates and Fertility Rates, by Age for Alaska: Selected Years, 1970-2010.

designated the middle series. A total of all possible sets of assumptions would produce 30 series representing each possible combination of the high, middle and low assumptions plus three series which assume zero net migration. Due to space limitations only selected series are shown.

The projections assume a constant level of growth each year throughout the period. They will, therefore, tend to be more accurate in the long run than over short periods. This is because the economy fluctuates more in short periods, but tends to average out to more stable growth over several years. While no boom/bust cycles are built into the projections, users can account for such events. A sudden boom or bust can be adjusted for in two ways. First, the reader may adjust for a sudden economic shift by shifting series. If a sudden boom occurs the reader may find that the high projection series for a given year is most accurate and vice versa. The second way to adjust for sudden economic change is to lag or lead the trend. Over time, the estimated population will gradually run ahead or behind the projection as economic conditions vary. The user can fine tune these projections in future years by locating the middle projection that matches a current population estimate and renaming the projection years accordingly.

As stated earlier, unforseen historic events can rapidly change the demographic setting. The actual population in the future will not exactly match the projected population. Although it is possible to forecast the statistical accuracy of sets of population projections, it is not yet possible to set reliable confidence intervals around population projections for Alaska because of a lack of a historical set of projections.

The national assumptions used in this set of projections are those employed in the most recent U.S. Census Bureau projections. These appear in the Projections of the Population of the United States, by Age, Sex and Race: 1988 to 2080 by Gregory Spencer, Current Population Reports, Series P-25, No 1018, January 1989.

Alternative Fertility Assumptions

Table B shows the range of fertility assumptions by race used in this set of projections. Change in high, middle and low series parallels the most recent set of national projections. Alaska has one of the highest fertility rates in the nation and that relationship to the national fertility is preserved. However, since the most recent Census Bureau projections do not incorporate the baby boom that has occurred since 1986, the national fertility levels were adjusted for real fertility trends to 1990 before the levels of fertility for Alaska were set. The relative difference between Alaska and the U.S. is retained and no convergence toward the national rates is assumed.

Fertility in the middle series is assumed to reach a completed cohort fertility of 2.6 births per woman in 2010. For the low and high series, levels of 2.3 and 3.0 births respectively are assumed. The relationship of fertility by race is also projected to continue to hold the same relationship to the state total that it currently holds. Thus for the projection period, no convergence of Native and White fertility is assumed. By 2010, White completed fertility is assumed to reach 2.4 children in the middle series and 2.1 and 2.8 in the low and high series respectively. Native completed fertility in the middle series is assumed to remain at 3.8 children in the middle series and 3.4 and 4.2 in the low and high series respectively.

At the census area level, the share of the state fertility contributed by each census area remains constant within each series throughout the projection period. Thus, high fertility areas retain their relative status with higher or lower series.

Alternative Mortality Assumptions

Assumptions regarding future mortality were projected from Alaska State Life tables from 1977-83 and national life expectancy derived from 1986 National Center for Health Statistics publications. While more current information is desirable these are the most recent available. Since mortality is the component least sensitive to change, the currency of the life table base is not a major drawback for the projections. It was assumed that mortality in Alaska remains higher than the national average during the time of these projections, but that life expectancy increases at the same rate as the national life expectancy. The current mortality differential observed between Alaska and the U.S. is retained. The changes in mortality are shown in Table C.

The national mortality projections assume separate trends for males and females. The middle scenario follows the national trend in mortality improvement and continues to follow a past forecast that has proven accurate. The low mortality forecast used in the high growth scenario assumes that life expectancy improves 50 percent faster than the middle series. Death rates used in the low series assume that mortality will improve half as fast as the middle series.

Because there is no national life expectancy information for Native Americans, we assumed that the pace of improvement in Native mortality will follow that of Blacks nationwide. Alaska Native mortality is substantially higher than for Blacks nationwide. We have little reason to expect it will change at a more rapid pace.

Life expectancy is projected to increase under all three assumptions. Life expectancy at birth for Alaskans is slightly lower than for the U.S. as a whole. Similarly, life expectancy for men in Alaska is lower relative to women than is found in the U.S. as a whole. This is in part because Alaska men tend to work in higher risk occupations.

If the actual mortality in Alaska follows the national projected trends, the projected middle series life expectancy will reach 72.9 by 2010 for Alaska men and 80.0 for Alaska women. For Whites the life expectancy will be 73.7 for men and 80.9 for women. For Alaska Natives the projected life expectancy in 2010 is 66.7 years for men and 75.7 years for women.

At the census area level, the statewide age/sex pattern of mortality is assumed even though actual levels of mortality are projected independently for each area based on their current share of statewide mortality. The assumptions of mortality for the three series are opposite of those of fertility. Thus a high series assumes high fertility but low mortality and vice versa.

Alternative Migration Assumptions

The assumptions adopted for these projections are set by establishing reasonable high and low ranges based on historical precedent. In this set of projections, we drew upon the history of Alaska population growth since statehood, particularly that of the last ten years. The wide statistical variation in year to year growth was employed to determine the mean and standard deviation of growth. While the observations are limited, the use of this statistical information allows a more sound approach than simply assuming a set of levels.

In choosing assumptions of migration, the net level of migration for the 1980's was chosen as the model.

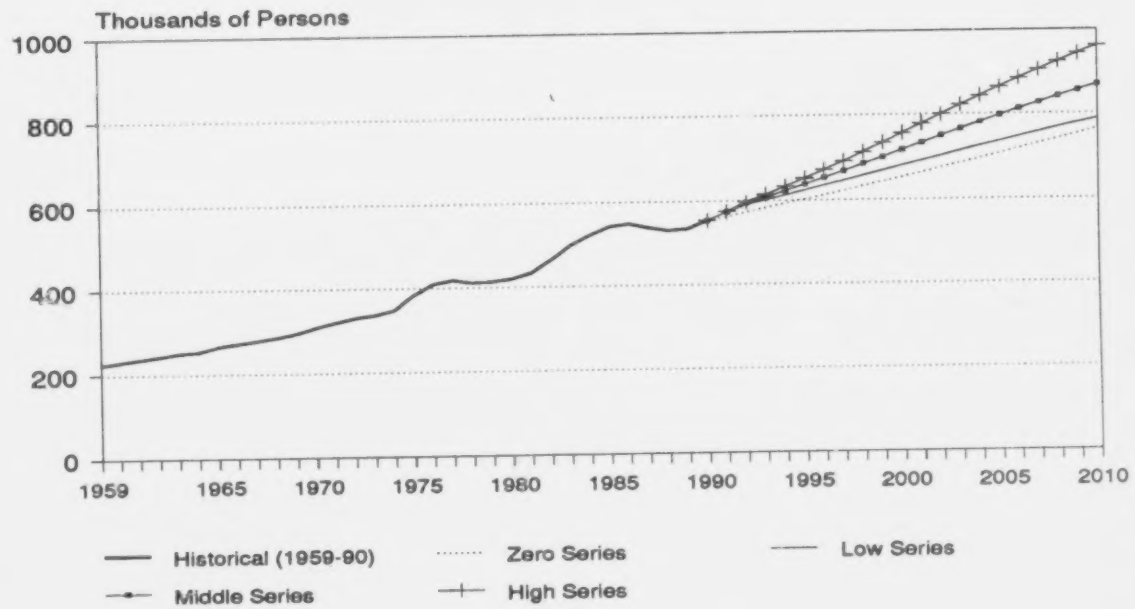
Figure 1
Alaska Population Trends: Historical and Projected, Statehood - 2010.



Source: Alaska Dept of Labor, Research & Analysis, Demographic Unit.

Not only is this the most recent historical pattern of migration for the state, but the net migration for the 1980's was the lowest proportional migration rate since statehood. In spite of extremes of boom and bust, the overall growth of the state through migration over the long-term has provided a relatively stable trend. While we assumed a linear migration trend for the 1993-2000 period, a slightly higher than average growth in net migration was assumed for 1991 and 1992. This was done to reflect the trend currently observed for 1991. After 1992, it is assumed the average rates of in and out migration experienced during the 1980's will continue.

Recent Alaska history shows no large scale net population loss or gain through migration that lasted for more than 4-5 years, so it is not reasonable to produce a series that assumes a continual large, long-term gain or loss through migration.

The low and high series represent levels of in and out migration that are consistently one standard deviation above and below the experience of the 1980's for each race group. Thus, the low series assumes in-migration to be one standard deviation lower and out migration to be one standard deviation higher. The high series assumes the opposite. The zero projection series assumes the middle levels of fertility and mortality and about a 9% annual rate of in and out migration. This series does not eliminate the impact of the age structure of migration, but shows what happens to the state's population if there is a zero gain through migration. For the Native population, the middle series and the zero series are the same. This is because the net migration for Alaska Natives out of the state is so close to zero. In setting the migration levels for Whites, the trend in White verses Black and Asian and Pacific Islander migration to the state was continued.

Migration is gradually allowed to trend toward zero in all series between 2000 and 2010. This is done to dampen the effects of growth at the extreme point in the projection. Knowledge of migration trends twenty years hence is so speculative that it is more reasonable to let natural increase account for all growth at the furthest point.

State Population Size and Growth

Between 1959 and 1990, the population of Alaska grew by 329,600, an increase of almost 150%. Growth rates historically have varied greatly from a high of 9.8% growth in the oil pipeline boom year of 1974-75 and 7.1% during the peak in capital expenditures in 1982-83 to a low of -1.8% during the oil market collapse in 1987. The key characteristic of Alaska's growth is its rapid fluctuation from year to year. The average annual growth rate over the 1959-90 period however has been 2.73%. The annual average growth rate for the 1980's was 2.75%. The Native population of Alaska grew from 64,103 in 1980 to 86,300 in 1990 at an average annual rate of 2.97% per year during the decade.

Statewide projections for each series are shown in Figure 1 and annually by single year of age, sex and selected ages by race (White and Alaska Native) for 1990-1995, 2000, 2005 and 2010 in Tables 1.1-1.42 which appear at the end of this chapter. Population pyramids showing the population by age, race and sex are shown in Figures 2 thru 6.

In Table D, the annual growth rates and racial distributions are compared among the projection series. As expected, growth rates among series are greatest in the high series and the least in the low series. In terms of racial groups, annual growth rates from 1990 to 2010 are highest for the Other race category in all series, which is primarily due to the continuing projected increase of Asian populations. Consequently, this group also shows the greatest gain in racial distribution from 1990-2010, gaining from 0.8% to 1.1% from 1990 depending on the series. Whites have the next highest growth rate for 1990-2000 in all series, while Natives have the lowest annual rate of growth for the 1990s. During the next decade, however, this pattern reverses and Natives have a higher growth rate than Whites, and a subsequent gain in racial distribution while Whites show a loss in their share. This is due to the projection model having migration tending to zero in all series between 2000-2010 to dampen the effects of growth at the extreme projections. Since Natives are least affected by migration trends and are most affected by natural increase, it then allows Natives to gain on Whites who would be more negatively impacted by a zero migration.

Table D.
Population Growth Rates and Racial Distributions, 1990-2010

Components of Change

The components of change are births, deaths and migration. Of these, migration has the greatest impact of projected growth, followed by fertility. Projected components of change are shown in Tables E-H.

Births

Alaska has always had one of the highest fertility levels in the country. Two different measures of fertility are presented here, the total fertility rate (TFR) and the age specific fertility rate (ASFR). The total fertility rate is the number of children a woman would bear during her reproductive lifetime if she had children at the current pattern of age specific fertility rates throughout all of her child bearing years. Age specific fertility rates are the number of children per 100 women of a specific childbearing age (e.g. 20-24). A total fertility rate of 2,585 per 1,000 women is frequently interpreted as 2.6 children per family.

National fertility declined from a high of 3.5 children per family in 1960 to a low of 1.7 in 1985. Starting in 1987, however, nationwide fertility showed a sudden resurgence back to 2.3 children in 1990. Alaskan levels of fertility declined to a low of 2.0 children in 1976, then gradually rose to almost 2.6 children in 1990. Alaska continues to have higher fertility than almost any state. This trend is projected to continue. Trends for Alaskan fertility are shown in Table B.

While the fertility of Alaska Natives is higher than that of White Alaskans, both are high and increasing. The White total fertility was 1.9 in 1975, but rose to 2.4 by 1990. Native total fertility, at a low of 2.9 in 1975, increased sharply to 3.9 by 1990, a level higher than many developing nations.

In comparing Alaska birth patterns from 1975 and 1990, one notes that while births to women 15-19 declined from 70 per 1000 in 1975 to 64 per 1000 in 1990, births to all women 20-39 increased. The increase is particularly apparent for women in their 30's, with births to women 35-39 doubling from 19 per 1000 in 1975 to 41 per 1000 in 1990. Women in their 20's continue to account for the majority of births with late marriage and postponed childbearing distributing the births fairly evenly for this group. The sharp increase in births to women in their thirties is attributed to women postponing births until late in

their childbearing years. The increases in age specific fertility are similar for both Whites and Alaska Natives. However, the resurgence of teen and early 20's fertility for Alaska Natives has been steeper than for Whites.

In 1990, there were approximately 11,700 births to Alaskans. Under our middle series, that number increases to 14,500 by 2000 and 17,500 by 2010. The low series produces 12,900 births by 2000 and 14,400 annually by 2010. The high scenario generates 16,500 births a year by 2000 and 21,600 by 2010. Eliminating the effect of migration yields 13,100 births annually by 2000 and 15,300 by 2010. Thus the impact of the variation in-migration on births is differential. Low levels of in-migration to the state would reduce the annual births by as much as 900 a year by 2010, whereas high levels of in-migration would add up to 6,300 births by that year. This is because the average migrant to Alaska is typically in

their 20's, the ages with the highest age specific fertility.

Under the middle series, by 2010, Alaska Natives would make up 15.6% of the population, but have 22% of the babies born to Alaska residents.

Deaths

Death is the factor with the least impact on the projections. In 1990, approximately 2,100 Alaskans died. Under our middle series, that number reaches about 2,900 by 2000 and 3,900 by 2010. Under our low growth series, which assumes higher mortality, deaths reach 3,100 by 2000 and 4,400 by 2010. If the high growth series prevails, deaths would be 2,800 by 2000 and 3,400 by 2010. By eliminating the impact of migration, deaths total 2,800 in 2000 and 3,600 by 2010. Deaths vary by only 1,000 between the high and low series at the furthest point in the projections.

Migration

In 1989-90, approximately 55,300 persons moved to Alaska and 45,700 left: a net gain of about 9,600. The average net migration for the 1980's was 3,702 per year even though migration ranged from a high of +24,300 to low of -19,600 for individual years.

All projection series assume a net migration of about 10,700-10,800 migrants for 1990-91. The middle series assumes a net gain of 9,100 for 1991-92 and 4,000 to 5,000 annually for the remainder of the decade. In the low series, a net increase of about 6,500 occurs in 1991-92 with an annual net gain of 1,300-1,500 through the 1990s. In the high series, an increase of 11,700 for 1991-92 is followed by a 7,000-8,500 annual net migration during the decade. For the zero series, migration is kept at zero net migration each year of the projection period.

Net migration for all series gradually declines from the stated level in 2000 to zero in 2010.

Age Distribution

Trends in selected age groups are shown in Tables I-J and Figures 7-15. Detailed age information is shown in Tables 1.1-1.42 following the discussions.

Median age

As with the United States as a whole, one of the most noticeable trends is the aging of the population. The median age in Alaska in 1990 was 29.5; 29.5 for men and 29.4 for women. The median was 30.8 for Whites but only 24.0 for Alaska Natives.

While the middle series projection shows an increase in median age to 30.4 statewide by 2000, the median age for Whites increases to 31.5 and the Native median declines to 22.8. By 2010, we expect the median age to increase to 31.4 with a median of 32.8 for Whites and 23.1 for Natives.

Under the low series, the population ages more rapidly. Lower levels of migration contribute to a more rapid aging of the population. The statewide median age is 30.8 in 2000, with the median for Whites at 31.9 and Natives at 22.9. By 2000, the statewide median climbs to 32.2 with 33.6 for Whites and 23.5 for Natives.

In the high series, the median age actually declines to 28.9 by 2000, with a White median of 31.0 and a Native median of 22.0. The median in 2010 is 30.5, with a White median of 31.8 and a Native median age of 21.6. In this series, the high turnover from migration continues to keep the population younger.

If the zero series was zero net migration with average turnover, it would yield a median age in 2000 of 30.9, 32.3 for Whites and 22.8 for Natives. Under the zero series for 2010, the median age rises to 31.8, with a median for Whites of 32.7 and 23.1 for Natives.

Dependency ratio

The dependency ratio measures how many persons of nonworking ages must be supported by each person of key working age. Changes in the age structure are reflected in burden of dependency carried by adults. In 1990, the Alaska youth dependency was 48.3 and the aged dependency was 6.3. That means there were 48.3 children under 18 and 6.3 persons over 65 per 100 persons 18-64. This compares to a 1990 U.S. youth dependency of 41.6 and a national aged dependency of 20.2 per 100 adults. Because of Alaska's young age structure, its youth dependency is higher than the national average and its aged dependency substantially lower. The overall burden of dependency for Alaskans averages somewhat less than the national average at 54.6 persons per 100 adults compared to 61.8 persons per 100 adults nationwide.

For Whites in Alaska in 1990, the youth dependency was 43.4 and the aged dependency was 6.0. For Alaska Natives, the dependency was much higher. The youth dependency was 74.6 and the aged dependency 8.7.

By 2000, the middle series youth dependency is projected to be 45.9 and the aged dependency 7.8 per 100 adults, with White dependency at 40.7 and 7.6 and Native dependency at 81.0 and 10.6. This shows a continued sharp increase in dependency for the Native population, placing an even greater burden on limited incomes than currently exists. Nationwide, the total dependency burden is projected to be 60.0 by 2000, compared to 53.7 per 100 adults for Alaska.

In the low series for 2000, youth dependency is projected to be 44.2 and aged dependency 8.0 statewide. White dependency is projected at 38.7 and 7.8 and Native dependency at 82.2 and 10.9 respectively.

In the high series, dependency at the turn of the century is 47.9 for youth and 7.7 for older persons per 100 adults. White dependency under this scenario is 42.3 and 7.5, while Native dependency reaches 86.0 and 10.4 respectively. Notice that the increase in aged dependency shows the highest proportional increase but is least affected by the different series' assumptions.

Younger ages

In 1990, 54,983 or 9.9% of the state's population was under 5. In our middle series projection, the number of children under 5 increases to 68,089 by 2000 and 80,757 by 2010. In the low series this group reaches 60,266 by 2000 and 66,722 by 2010. The high series projects 77,316 by 2000 and 99,498 by 2010. In the middle series, by 2000, 20.9% of all children under 5 are Alaska Native.

The school age population represents another key age group for planning purposes. In 1990, there were 118,008 children between 5 and 17 in Alaska (87,564 age 5-13 and 30,444 age 14-17). The middle series shows the population 5-17 increasing to 145,965 by 2000 and 168,417 by 2010. Overall, the middle series projects a 23.7% increase in school age population by 2000 and a 42.7% increase by 2010. Of school age children, 21.8% are Alaska Natives at the turn of the century.

The low series projects 137,312 school age children by 2000 and 143,486 by 2010. This series projects a 16.4% increase by 2000 and a 21.6% increase by 2010. The high series, on the other hand, projects 155,244 persons 5-17 by 2000 and 198,515 by 2010, a 31.6% increase by 2000 and a 68.2% increase by 2010. Unfortunately, school ages are among the more volatile in Alaska's population so there is a substantial range of growth for these age groups over the next 20 years.

Older Alaskans

Probably the greatest nationwide trend for the next decades will be the increase of the older population. In 1990, 12.5% of the U.S. population was over 65. This population is projected to increase about 13% by 2000 and about 14% by 2010.

In Alaska, in 1990, about 22,459 persons or 4.1% of the population was over 65. The middle series projects

Figure 13

that number to increase to 36,345 or 5.1% by 2000 and 53,665 or 6.2% by 2010. Older Alaskans are expected to increase by 61.8% over the next decade with a 138.9% increase by 2010. The low series shows 51,111 or 6.5% older Alaskans by 2010; the high series shows 57,093 or 5.9%. Clearly, a doubling of the burden on facilities and programs for older Alaskans in this decade will be a major problem for the state.

Further into the next century, the growth of older Alaskans is shown in the growth of the population over 55 from 2000-2010. In the middle series, the number of persons 55-64 rises from 41,753 in 2000 to 75,836 in 2010. Thus, the number of older Alaskans will increase even faster in the 2010-2020 period. Changing the assumptions for the different series has little impact on the 65+ population.

In 1990, 18.2% of the population over 65 was Alaska Native. By 2010, that proportion should decline to 15.2%, much closer to the overall proportion of Natives in the population.

ALASKA

POPULATION PROJECTIONS

Chapter 2

Borough and Census Area Projections

The levels of growth chosen for the census areas also reflect the historical levels of the recent past. The middle projection reflects a continuation of the growth trend set during the 1980's. The high and low in and out migration levels were set one standard deviation above and below the mean census area in and out migration of the decade. All three series were then controlled to the state projection. The census area age/sex pattern of migration reflects patterns observed in the 1988-89 period.

Tables 2.1-2.6 present the middle, low and high projected populations for the census areas and labor market regions of the state for 1990-2000. In addition, projected populations for four key age groups are presented.

The projections for all census areas are controlled to the statewide series total. Thus, the reader may find that the high projection series may produce a lower projection for some census areas than the middle or low series. This is because of differential growth of the census areas relative to the state series control totals.

The total population for census areas appears in Table 2.1. In general, the projections show the continued growth of the urban areas of Alaska through migration and the rural Native areas through natural increase. In the middle series, the population projections for 2000 are Anchorage Borough 285,000, Fairbanks North Star Borough 105,000, Matanuska-Susitna Borough 69,700, Kenai Peninsula Borough 56,200 and Juneau Borough 33,200. Of the rural Native areas, North Slope Borough, Northwest Arctic Borough, and Wade Hampton Census Area show the most rapid growth.

Table 2.2 presents projected population of working age 16+ and projections of the civilian labor force implied by these projections. In addition to projecting the population of working age, we have projected the implied labor force. The March 1990 benchmark civilian labor force was divided by the 1990 census population to estimate the labor force participation rate for 1990. This rate was held constant throughout the decade. In addition, we used 1990 military employment to establish the civilian labor force. These numbers can be compared with actual civilian labor force estimates, particularly annual average estimates found in Alaska Economic Trends to determine how the labor force is tracking with the projection series over time. Under the middle series projection, the civilian labor force grows from 251,000 in 1990 to 339,000 by 2000, with the range varying from 324,400 to 355,400.

Table 2.3 shows projections of school age population 5-17 by census area for the 1990s. Table 2.4 shows the projected population 18-24. This group is of potential post-secondary education, military enlistment and job force entry age. Table 2.5 shows projections of the population 65+ for the decade. Finally, Table 2.6 shows the projected middle series population by five year age and sex and median age for each census area for 1990 and 1995. Beyond 1995, the model becomes unstable for small rapidly changing census areas with this degree of age/sex detail.

Space allows presentation of only the most frequently used ages but we may be able to provide information for other age groups on request. We hope the range of detail presented here provides most of the information needed to make planning decisions.
